

How to create a rain garden

Designing and planting a rain garden is much like creating any other perennial garden, with a few unique differences.

The garden must be located where runoff can be diverted into it, away from building foundations and utilities.

A shallow, saucer-shaped depression is created in the garden to hold rain as it soaks in.

Soil replacement and additional preparation are sometimes needed for success. A good soil mix for rain gardens is 50-60% sand, 20-30% topsoil, and 20-30% compost.

Species of perennial plants native to our region are recommended, as they are adapted to local conditions and will not need extra care once they are established.

A mulch of shredded hardwood is an integral part of your rain garden. It keeps the soil moist and ready to soak up rain, and makes your garden low-maintenance.

You can easily create a simple rain garden in a weekend, for no cost if you use plants you already have. Or, you can install a deluxe rain garden that will take more effort and investment. It's all up to you!

A beautiful solution to water pollution

The deep roots of native perennials make channels into the soil

You can help protect the Great Lakes and our streams, rivers, and inland lakes by planting a beautiful rain garden.

Keeping rain on your property, where it naturally belongs, will help solve some of our water pollution problems.

We are intimately connected to one of
the largest fresh water systems on earth,
and that water is in trouble.

20% of the
fresh
surface water
on Earth
is in the
Great Lakes.

What threatens it? We do.

When rain and snowmelt flow off our yards,
roofs, sidewalks, roads and parking lots, the
resulting stormwater runoff washes pollution
into our streams, rivers and lakes.

Up to 70% of the water pollution in our region
is carried there by stormwater. And much
of this pollution comes from things we do
in our yards and gardens!

Polluted stormwater runoff entering a river

Water wasn't meant
to run off our land.

Nature's original plan for rain is this:
To soak into the soil, replenish groundwater
supplies, be taken up by and filtered by plants,
and enter our surface waters as clean, cool
groundwater, nurturing and nourishing
our world.

This is where rain gardens come in.

A rain garden is a special kind of stormwater
garden designed to collect and absorb runoff
from a roof or parking lot. By planting a rain
garden, you can help solve some of our
stormwater problems.
